

一、(1) 共轭梯度法:

解: ① 第一轮迭代:

$$\nabla f(x) = \begin{pmatrix} 3x_1 - x_2 - 2 \\ x_2 - x_1 \end{pmatrix} \quad \nabla f(x^{(0)}) = \begin{pmatrix} -2 \\ 0 \end{pmatrix}$$

$$\text{第一轮迭代搜索方向 } S^{(0)} = -\nabla f(x^{(0)}) = \begin{pmatrix} 2 \\ 0 \end{pmatrix}$$

$$\text{迭代新点 } x^{(1)} = x^{(0)} + \alpha S^{(0)} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} + 2 \begin{pmatrix} 2 \\ 0 \end{pmatrix} = \begin{pmatrix} 4 \\ 0 \end{pmatrix}$$

$$f(x^{(1)}) = 6 \cdot 2^2 + (-4 \cdot 2)$$

$$\text{由 } \frac{df(x^{(1)})}{d\alpha} = 0, \text{ 得 } 12 \cdot 2 - 4 = 0, \text{ 解得 } \alpha = \frac{1}{3}$$

$$\therefore x^{(1)} = \left(\frac{2}{3}, 0\right)^T, \quad \nabla f(x^{(1)}) = \begin{pmatrix} 0 \\ -\frac{2}{3} \end{pmatrix}$$

$$\therefore \|\nabla f(x^{(1)})\| = \frac{2}{3} > 0.1 \quad \text{故进行下一轮迭代}$$

② 第二轮迭代:

$$\text{共轭系数 } \beta = \frac{\|\nabla f(x^{(1)})\|^2}{\|\nabla f(x^{(0)})\|^2} = \frac{\frac{4}{9}}{4} = \frac{1}{9}$$

$$\text{共轭方向 } S^{(1)} = -\nabla f(x^{(1)}) + \beta S^{(0)} = \begin{pmatrix} 0 \\ \frac{2}{3} \end{pmatrix} + \frac{1}{9} \begin{pmatrix} 2 \\ 0 \end{pmatrix} = \begin{pmatrix} \frac{2}{9} \\ \frac{2}{3} \end{pmatrix}$$

$$\text{迭代新点 } x^{(2)} = x^{(1)} + \alpha S^{(1)} = \begin{pmatrix} \frac{2}{3} \\ 0 \end{pmatrix} + \alpha \begin{pmatrix} \frac{2}{9} \\ \frac{2}{3} \end{pmatrix} = \frac{2}{3} \begin{pmatrix} 1 + \frac{1}{3}\alpha \\ \alpha \end{pmatrix}$$

$$f(x^{(2)}) = \frac{4}{27} \alpha^2 - \frac{4}{9} \alpha - \frac{2}{3}$$

$$\text{由 } \frac{df(x^{(2)})}{d\alpha} = 0, \text{ 得 } \frac{8}{27} \alpha - \frac{4}{9} = 0, \text{ 解得 } \alpha = \frac{3}{2}$$

$$\therefore x^{(2)} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \quad \nabla f(x^{(2)}) = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\therefore \|\nabla f(x^{(2)})\| = 0 < \varepsilon$$

故 $x^{(2)} = [1, 1]^T, f(x^{(2)}) = -1$ 即为所求最优解.

(2) 阻尼牛顿法:

$$\nabla f(x) = \begin{pmatrix} 3x_1 - x_2 - 2 \\ x_2 - x_1 \end{pmatrix} \quad \nabla f(x^{(0)}) = \begin{pmatrix} -2 \\ 0 \end{pmatrix}$$

$$H(x) = \begin{pmatrix} 3 & -1 \\ -1 & 1 \end{pmatrix} \quad [H(x)]^{-1} = \begin{pmatrix} 0.5 & 0.5 \\ 0.5 & 1.5 \end{pmatrix}$$

$$\text{牛顿方向 } S^{(0)} = -[H(x^{(0)})]^{-1} \nabla f(x^{(0)}) = -\begin{pmatrix} 0.5 & 0.5 \\ 0.5 & 1.5 \end{pmatrix} \begin{pmatrix} -2 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$$

$$\text{迭代起点 } x^{(1)} = x^{(0)} + \alpha S^{(0)} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} + \alpha \begin{pmatrix} 1 \\ 1 \end{pmatrix} = \begin{pmatrix} \alpha \\ \alpha \end{pmatrix}$$

$$f(x^{(1)}) = \alpha^2 - 2\alpha$$

$$\text{令 } \frac{df(x^{(1)})}{d\alpha} = 0, \text{ 得 } 2\alpha - 2 = 0, \text{ 解得 } \alpha = 1$$

$$\therefore x^{(1)} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \quad \nabla f(x^{(1)}) = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\therefore \|\nabla f(x^{(1)})\| = 0 < \varepsilon$$

故 $x^{(1)} = [1, 1]^T$, $f(x^{(1)}) = -1$ 即为所求最优解

二. 使用单纯形法(大M法)求解下列线性规划问题

$$\begin{aligned} \max f(x) &= 3x_1 + 2x_2 \\ \text{s.t.} \quad &\begin{cases} 2x_1 + x_2 \leq 2 \\ 3x_1 + 4x_2 \geq 12 \\ x_1, x_2 \geq 0 \end{cases} \end{aligned}$$

解: 将原问题模型转化为线性规划标准模型

$$\begin{aligned} \min f(x) &= -3x_1 - 2x_2 \\ \text{s.t.} \quad &\begin{cases} 2x_1 + x_2 + x_3 = 2 \\ 3x_1 + 4x_2 - x_4 = 12 \\ x_1, x_2, x_3, x_4 \geq 0 \end{cases} \end{aligned}$$

添加人工变量

$$\begin{aligned} \min f(x) &= -3x_1 - 2x_2 + Mx_5 \\ \text{s.t.} \quad &\begin{cases} 2x_1 + x_2 + x_3 = 2 \\ 3x_1 + 4x_2 - x_4 + Mx_5 = 12 \\ x_1, x_2, x_3, x_4, x_5 \geq 0 \end{cases} \end{aligned}$$

基变量	变量x	x ₁	x ₂	x ₃	x ₄	x ₅	约束方程	替换系数
x ₃	变量系数C	-3	-2	0	0	M	b	2
x ₅	M	3	4	0	-1	1	12	3
判别数C		-3-3M	-2-4M	0	M	0		

$$\text{基本可行解 } x^{(0)} = [0, 0, 2, 0, 12]^T$$

基变量	变量x	x ₁	x ₂	x ₃	x ₄	x ₅	约束方程	替换系数
x ₃	变量系数C	-3	-2	0	0	M	b	2
x ₂	-2	2	1	1	0	0	2	
x ₅	M	-5	0	-4	-1	1	4	
判别数C		5M+1	0	4M+2	M	0		

原问题无可行解.

三. 使用内罚函数求解下面约束优化问题

$$\min f(x) = \frac{1}{3}(x_1+2)^2 + x_2$$

$$\text{s.t.} \begin{cases} 2-x_1 \leq 0 \\ x_2 \geq 0 \end{cases}$$

解: 构造内罚函数

$$\varphi(x, r) = \frac{1}{3}(x_1+2)^2 + x_2 - r\left(\frac{1}{2-x_1} - \frac{1}{x_2}\right)$$

令 $\nabla \varphi(x, r) = 0$, 得

$$\begin{pmatrix} (x_1+2)^2 - \frac{r}{(2-x_1)^2} \\ 1 - \frac{r}{x_2^2} \end{pmatrix} = 0, \text{ 解得 } \begin{cases} x_1 = \sqrt{4+r} \\ x_2 = \sqrt{r} \end{cases}$$

令 $r \rightarrow 0$, 得 $\begin{cases} x_1 = 2 \\ x_2 = 0 \end{cases}$

故 $x^* = [2, 0]^T$, $f(x^*) = \frac{64}{3}$

四. 使用外罚函数求解下面约束优化问题

$$\max \min f(x) = \frac{1}{2}(x_1+2)^2 + x_2$$

$$\text{s.t.} \begin{cases} 2-x_1 \leq 0 \\ x_2 \geq 0 \end{cases}$$

解: 构造外罚函数 $\varphi(x, M) = \frac{1}{2}(x_1+2)^2 + x_2 + M[(\max\{0, 2-x_1\})^2 + (\max\{0, x_2\})^2]$

① 当 $2-x_1 \leq 0, x_2 \leq 0$ 时

$$\varphi(x, M) = \frac{1}{2}(x_1+2)^2 + x_2$$

$$\nabla \varphi(x, M) = \begin{pmatrix} x_1+2 \\ 1 \end{pmatrix} \neq 0$$

不满足题意

② 当 $2-x_1 > 0, x_2 \leq 0$ 时

$$\varphi(x, M) = \frac{1}{2}(x_1+2)^2 + x_2 + M(2-x_1)^2$$

令 $\Delta \varphi(x, M) = 0$, 得

$$\Delta \varphi(x, M) = \begin{pmatrix} x_1+2-2M(2-x_1) \\ 1 \end{pmatrix} \neq 0$$

不满足题意

③ 当 $2-x_1 \leq 0, x_2 > 0$ 时

$$\varphi(x, M) = \frac{1}{2}(x_1+2)^2 + x_2 + Mx_2^2$$

令 $\nabla \varphi(x, M) = 0$, 得 $\begin{pmatrix} x_1+2 \\ 1+2Mx_2 \end{pmatrix} = 0$

$$\text{解得 } \nabla \varphi(x, M) = \begin{pmatrix} x_1+2 \\ 1+2Mx_2 \end{pmatrix} = \begin{pmatrix} x_1+2 \\ x_2 = -\frac{1}{2M} \end{pmatrix}$$

不满足假定条件

④ 当 $2-x_1 > 0, x_2 > 0$ 时

$$\varphi(x, M) = \frac{1}{2}(x_1+2)^2 + x_2 + M[(2-x_1)^2 + x_2^2]$$

令 $\nabla \varphi(x, M) = \begin{pmatrix} x_1+2-2M(2-x_1) \\ 1+2Mx_2 \end{pmatrix} = 0$

$$\text{解得 } \begin{cases} x_1 = \frac{4M-2}{2M+1} \\ x_2 = -\frac{1}{2M} \end{cases} \quad \text{令 } M \rightarrow +\infty, \text{ 得 } \begin{cases} x_1 = 2 \\ x_2 = 0 \end{cases}$$

$\therefore x^* = [2, 0]^T, f(x^*) = 8$

$$B: \min f(x) = -3x_1 - 2x_2$$

$$s.t. \begin{cases} 2x_1 + 3x_2 \leq 12 \\ 9x_1 + 3x_2 \leq 40 \\ x_1, x_2 \geq 0 \end{cases}$$

$$(x_1=4, x_2=\frac{4}{3}, f=-\frac{44}{3})$$

$$\text{下界} = -\frac{44}{3} \quad \text{上界} = +\infty$$

⇒ 将 B 按 x_2 分.

$$B_1: \min f(x) = -3x_1 - 2x_2$$

$$s.t. \begin{cases} 2x_1 + 3x_2 \leq 12 \\ 9x_1 + 3x_2 \leq 40 \\ x_1, x_2 \geq 0 \\ x_2 \geq 2 \end{cases}$$

$$(\cancel{x_1=\frac{37}{9}, x_2=1, f=-\frac{43}{3}})$$

$$(x_1=3, x_2=2, f=-13)$$

$$\text{下界} = -\frac{44}{3} \quad \text{上界} = -13$$

$$B_2: \min f(x) = -3x_1 - 2x_2$$

$$s.t. \begin{cases} 2x_1 + 3x_2 \leq 12 \\ 9x_1 + 3x_2 \leq 40 \\ x_1, x_2 \geq 0 \\ x_2 \leq 1 \end{cases}$$

$$(x_1=\frac{37}{9}, x_2=1, f=-\frac{43}{3})$$

$$\text{下界} = -\frac{43}{3} \text{ (最优)} \quad \text{上界} = -13$$

将 B_2 按 x_1 分.

$$B_3: \min f(x) = -3x_1 - 2x_2$$

$$s.t. \begin{cases} 2x_1 + 3x_2 \leq 12 \\ 9x_1 + 3x_2 \leq 40 \\ x_1, x_2 \geq 0 \\ x_2 \leq 1 \\ x_1 \leq 4 \end{cases}$$

$$(x_1=4, x_2=1, f=-14)$$

$$\text{上界} = -14 \text{ (最优上界)}$$

$$B_4: \min f(x) = -3x_1 - 2x_2$$

$$s.t. \begin{cases} 2x_1 + 3x_2 \leq 12 \\ 9x_1 + 3x_2 \leq 40 \\ x_1, x_2 \geq 0 \\ x_2 \leq 1 \\ x_1 \geq 5 \end{cases}$$

无可行解.
